PROFESSIONAL SUMMARY

Front-End Engineer with 3 years of production Angular and TypeScript experience on a live B2B IoT SaaS platform, sole frontend owner of 7 modules. Built real-time WebSocket dashboards with sub-2-second update latency, Ag-Grid tables handling 10,000+ rows, a schema-driven @ngx-formly forms engine, and NgRx state management across the product. Also shipped the Android app in Kotlin across 5 Play Store releases. Owns features end to end, from API contract to production rollout.

TECHNICAL SKILLS

Front-End: Angular 14+, TypeScript, JavaScript (ES6+), RxJS, NgRx, Reactive Forms, Angular CDK, HTML5, CSS3, SCSS, Tailwind CSS, React 18

UI & Data Rendering: Ag-Grid (server-side row model), @ngx-formly, virtual scrolling, pdfmake, SVG

Architecture & Performance: Reusable component libraries, lazy-loaded feature modules, OnPush change detection, bundle-size optimisation, npm workspaces monorepo, Vite

APIs & Real-Time: REST APIs, WebSocket, event streaming, server-side pagination, filtering, retry and error handling

Mobile: Kotlin, Android SDK, Google Play Console (internal, staged rollout, production tracks)

Full Stack & Data: Firebase (Auth, Firestore), Node.js (basic), JSON schema-driven configuration

Engineering Practices: Git, GitHub, code review, debugging and performance profiling, Postman, Chrome DevTools, VS Code

AI-Assisted Engineering: LLM-based code generation and prompt engineering in daily development workflow

PROFESSIONAL EXPERIENCE

Hash8.io Private Limited — Frontend & Mobile Engineer

Aug 2023 – Present | Hosur, Tamil Nadu | B2B IoT SaaS — LiftiQ / Sunbelt elevator monitoring platform

- Sole frontend engineer for 7 modules of a production platform: Status Dashboard, Trends Analytics, Event History, Digital Twin, Reports, Mapping and Administration.
- Built a WebSocket-driven live status dashboard delivering sub-2-second lift-state updates, replacing an HTTP polling model that showed operators stale data.
- Designed a schema-driven forms engine with @ngx-formly supporting conditional field visibility, async option loading and custom validators; new forms now ship as JSON configuration instead of new components, removing hardcoded form templates across the product.
- Managed application state with NgRx using actions, effects, reducers and selectors to keep filter state, grid queries and API payloads synchronised across modules.
- Scaled the event-history grid to 10,000+ rows using the Ag-Grid server-side row model with multi-column filtering and virtual scrolling, keeping interaction responsive on production datasets.
- Built a 3-tier notification platform (user, event and asset level) from scratch, extending an email-only setup to in-app and push channels with rule validation before API dispatch.
- Implemented a PDF reporting layer with pdfmake using a strategy-pattern builder registry, plus a unit-conversion system covering volume, temperature, pressure, weight, level and distance, wired into the NgRx store.
- Published a shared library of 12+ Angular components — data grids, filter panels, notification badges — reused across 3 modules to standardise UI patterns and cut feature scaffolding time.
- Owned Android delivery end to end: 5 production releases in Kotlin through Google Play Console internal, staged-rollout and production tracks with no critical post-release defects.
- Improved runtime and load performance by migrating high-frequency components to OnPush change detection and refactoring features into lazy-loaded modules, reducing initial bundle size.
- Integrated 8+ REST endpoints for alerts, notifications and event streaming with retry logic and error boundaries so data failures degrade gracefully instead of blanking the UI.
- Adopted AI-assisted code generation and prompt engineering in daily development, using it to scaffold components and draft refactors so more of my time went to architecture and review, then shared the workflow with the wider engineering team.

PROJECTS

Thozhil — Textile Business Management PWA

React 18, Vite, Firebase, npm workspaces, PWA

- Refactored a single-bundle React application into a Vite npm workspaces monorepo with three role-locked apps (Owner, Labour, Customer) sharing a common package layer, so a shared component or business rule is now changed in one place instead of three.
- Built on Firebase Auth and Firestore with role-based access per app, and shipped it as an installable offline-capable PWA so shop-floor users can work without a stable connection.

EDUCATION

B.E., Electronics and Communication Engineering

Government College of Engineering, Thanjavur | 2023 | CGPA 7.6 / 10
